GENERAL INFORMATION:
Patent No. 6551795
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18

Sequence 20154, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

APPLICANING MATCH.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1999-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 20154

The invention relates to an antiinflammatory compound (especially AAM48645), comprising a membrane translocation domain (AAM48620-AAM48645), comprising a membrane translocation domain (AAM48620-AAM48621) which comprises from 6-15 amino acid residues, fused to a NEMO binding sequence (AAM48525-AAM48619). The compounds have antiasthmatic, Cytostatic, antipsoriatic, antiarthritic, osteopathic, antibacterial, antistherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by contist that results in inhibition of IKKappaB. The compounds are useful comman that results in inhibition of IKKappaB. The compounds are useful companies in inhibition of IKKappaB. The compounds are useful contrasted phosphorylation of IKRappaB. The compounds are useful contrasts, inflammatory disorders, e.g. asthma, lung inflammatory concer, psoriasis, rheumatoid arthritis, osteoarthritis, inflammatory concer, psoriasis, rheumatoid arthritis, osteoarthritis, inflammatory concer, psoriasis, rheumatoid arthritis, suchimmune diseases such as lugus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis; transplant rejection; osteoporosis; Albeiame's diseases theoresicrosis; cuseful for treating pro-inflammatory responses such as allergies, curticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, very sunburn, aging and arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antinflammatory; antiasthmatic; cytostatic; antipsoriatic; nootropic; antirhematic; antiarthritic; osteopathic; antibacterial; virucide; immunosuppressive; dermatological; neuroprotective; antiatherosclerotic; antiallergic; membrane translocation domain; NENO binding domain; eczema; cytokine; NENAPBB, IRAPPB kinase beta; IKKDeta; cancer; psoriasis; rheumatoid arthritis; osteoparthritis; inflammatory bowel disease; autoimmune disorder; multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                       셤
                                                                             The invention relates to an antiinflammatory compound (especially AAM48629-AAM48645), comprising a membrane translocation domain (AAM48620-AAM48645) or AAM48646-AAM48646-AAM48646-AAM48646-AAM48646-AAM48646-AAM48646-AAM48649]. The medidues, fused to a NEMO binding sequence (AAM4852-AAM46619). The antiinflammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antiathratic, csteopathic, antibactarial, immunosuppressive, dermatological, neuroprotective, nootropic, antiatherosclerotic, virucide and antiallergic activity. The compounds cat as selective inhibitors of cytokine-mediated NFKAPAPBA activation by blocking interaction of IkAPAPBA kinase beta (IKKDeta) at the NEWO binding domain that results in inhibition of IKKDeta kinase activation and subsequent decreased phosphorylation of IKAPAPBA. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammatory disorders, e.g. asthma, lung inflammatory concert, psoriasis, rheumatoid arthritis, osteoarthritis, inflammatory concert, polymyalgia, scleroderma, granulomatosis, multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; cuseful for treating pro-inflammatory responses such as allergies, cutticaria, anaphylaxis, dung or food sensitivity, eczema, dermatitis, expense, anaphylaxis, dung or food sensitivity, eczema, dermatitis, expensed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation, psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           inflammatory bowel disease; sepsis; vasculitis; autoimmune disease; systemic lupus erythematosus; multiple sclerosis; cancer; osteoporosis; Alzheimer's disease; viral infection; NF-kappa B essential modulator;

                                                                                                                                                                                                                                                                                                                                                                                     The invention describes an anti-inflammatory compound comprising (I). The compound is useful for diagnosing or treating inflammatory disorders, such as asthma, psoriasis, rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, autoimmune diseases (e.g. systemic lupus erythematosus), multiple sclerosis, cancer, osteoporosis, Albahamer's disease or viral infection. This is the amino acid sequence of an anti-iflammatory peptide that binds to, and down-regulates, necrosis factor kappa B (NFkB) essential modulator (NEMO).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NEMO binding domain; NBD; I kappa B kinase beta; IKKbeta; antinflammatory; antiasthmatic; antibacriatic; antirheumatic; antiarthritic; osteopathic; antibacrerial; immunosuppressive; dermatological; neuroprotective; cytostatic; nootropic; virucide; gene therapy; anti-inflammatory; inflammatory disorder; asthma; psoriasis; rheumatoid arthritis; osteoarthritis; inflammatory bowel disease; sepsis; vasculitis; autoimmune disease; systemic lupus erythematoss; multiple sclerosis; cancer; osteoporosis; Alzheimer's disease; viral infection; NF-kappa B essential modulator; necrosis factor kappa B essential modulator;
                                                                                                                                                                                            New compound for diagnosing or treating inflammatory disorders, e.g. asthma, psoriasis, rheumatoid arthritis, inflammatory bowel disease or cancer, comprises a membrane translocation domain and a NEMO binding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation, psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antiinflammatory; antiasthmatic; cytostatic; antipsoriatic; nootropic; antirheumatic; antiarthritic; osteopathic; antibacterial; virucide; immunosuppressive; dermatological; neuroprotective; antiatherosclerotic; antialeragic; membrane translocation domain; NEMO binding domain; eczema; cytokine; NFkappaB; IkappaB kinase beta; IKKbeta; cancer; psoriasis; rheumatoid arthritis; osteoarthritis; inflammatory bowel disease; autoimmune disorder; multiple sclerosis; transplant rejection; osteoporials; disease; atherosclerosis; viral infection;
                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                             The invention describes an anti-inflammatory compound comprising (I). The compound is useful for diagnosing or treating inflammatory disorders, such as asthma, psoriasis, rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, autoimmune diseases (e.g. systemic lupus erythematosus), multiple sclerosis, cancer, osteoporosis, Alzheimer's disease or viral inflection. This is the amino acid sequence of an anti-iflammatory peptide that binds to, and down-regulates, necrosis factor kappa B (NFKB) essential modulator (NEMO).
                        New compound for diagnosing or treating inflammatory disorders, e.g. asthma, psoriasis, rheumatoid arthritis, inflammatory bowel disease or cancer, comprises a membrane translocation domain and a NEMO binding

The invention relates to an antiinflammatory compound (especially AAM48645), comprising a membrane translocation domain (AAM48620-AAM48621), comprising a membrane translocation domain (AAM48620-AAM48621) which comprises from 6-15 amino acid residues, fused to a NEMO binding sequence (AAM48525-AAM48619). The compounds have antiasthancic, cytostatic, antipsoriatic, antiarthritic, osteopathic, antibacterial, antiharensolerotic, virucide and antiasthanced control of the compounds of containtherosclerotic, virucide and antientergic activity. The compounds at as selective inhibitors of cytokine-mediated NFkappaB activation by act as selective inhibitors of cytokine-mediated NFkappaB activation by compound intar results in inhibition of IKAPpaB. The compounds are useful compound and antient in a selective inhibitors of cytokine-mediated NFkappaB activation and compound activation and subsequent decreased phosphorylation of IKAPpaB. The compounds are useful contracting inflammatory disorders, e.g. asthma, lung inflammatory cancer, psoriasis, rheumatoid arthritis, osteoporathritis, inflammatory concer, psoriasis, relatederma, granulomatosis, multiple sclerosis; transplant rejection; osteoporosis; Albadimer's diseases atherosclerosis; cransplant rejection; osteoporosis; Albadimer's diseases; atherosclerosis; transplant infections; and ataxia telanglectasia. The compounds are also urticaria, anaphylaxis, drug or food sensitivity, eczema, dermatitis, xxx
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NEMO binding domain, NBD; I kappa B kinase beta; IKKbeta; antinflammatory; antiasthmatic; antibacterial; immunosuppressive; antiarthritic; osteopathic; antibacterial; immunosuppressive; dermatological; neuroprotective; cytostatic; nootropic; virucide; gene therapy; anti-inflammatory; inflammatory disorder; asthma; psoriasis; rheumatory anti-inflammatory; inflammatory disorder; asthma; inflammatory bowel disease; sepsis; vaculitis; autoimmune disease; sepsis; vaculitis; autoimmune disease; sepsis; vaculitis; autoimmune disease; shystemic lupus erythematosus; multiple sclerosis; cancer; osteoporosis; Alzheimer's disease; viral infection; NF-kappa B essential modulator; necrosis factor kappa B essential modulator;
